#### Gaining reach (Downstream of SH6)

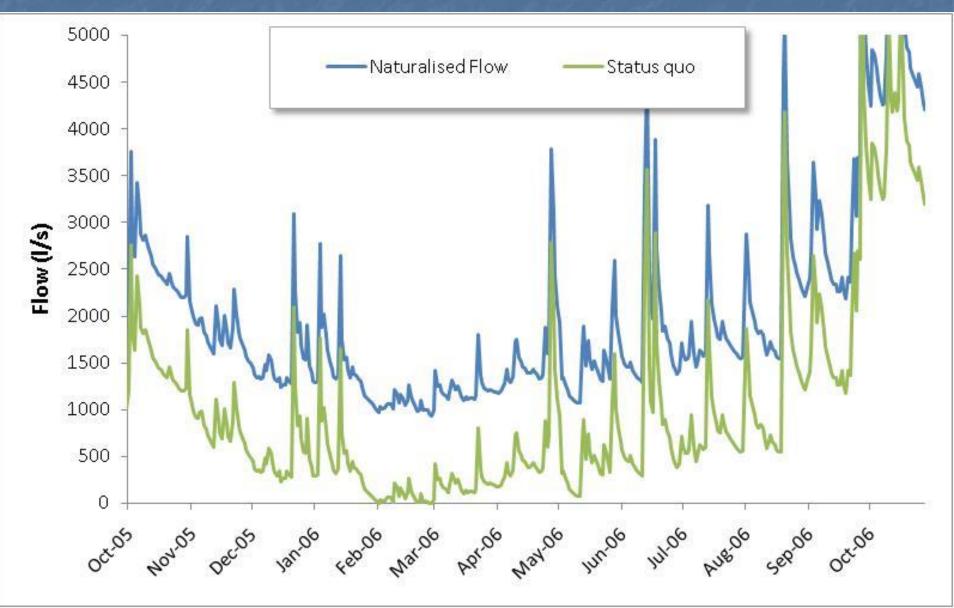

#### Disconnected losing reach (From The Larches to above SH6)

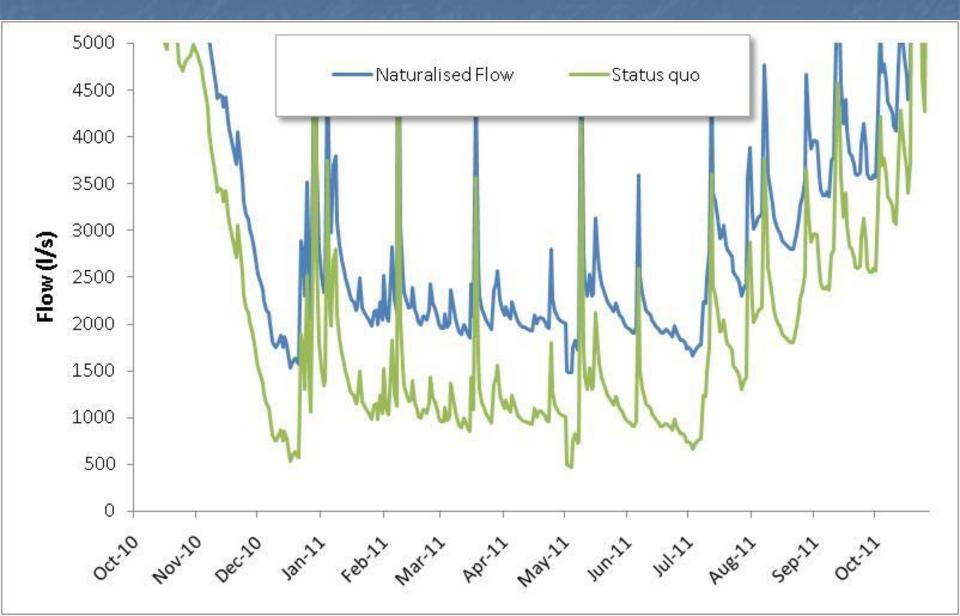

#### Minimum flow scenarios

- Status quo Carry on with the current set-up
- Flow continuity maintain surface flows throughout the irrigation season
- Dual minimum flow Maintain flow continuity until the end of Jan to allow juvenile trout to leave the Cardrona

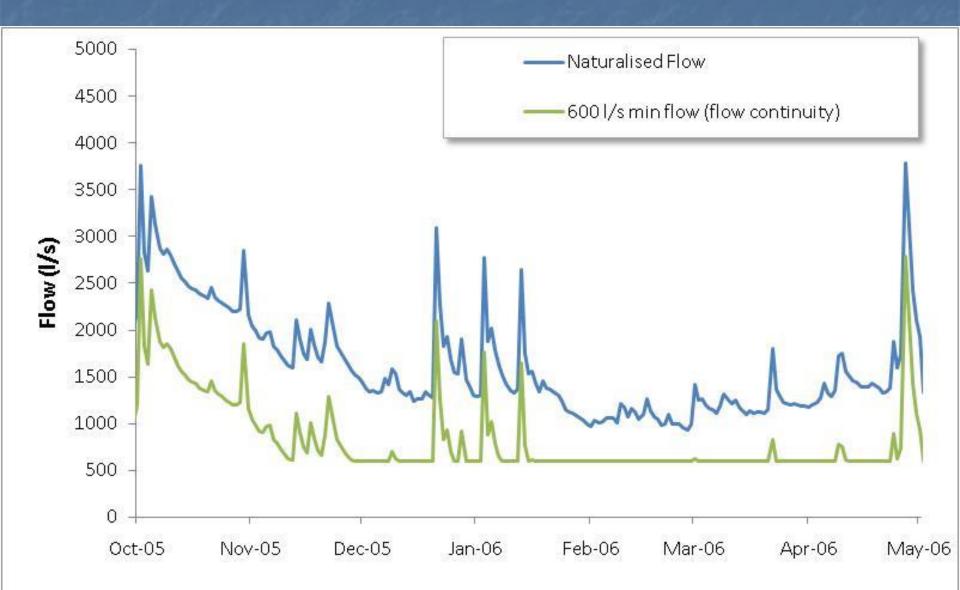

# Status quo – Dry year

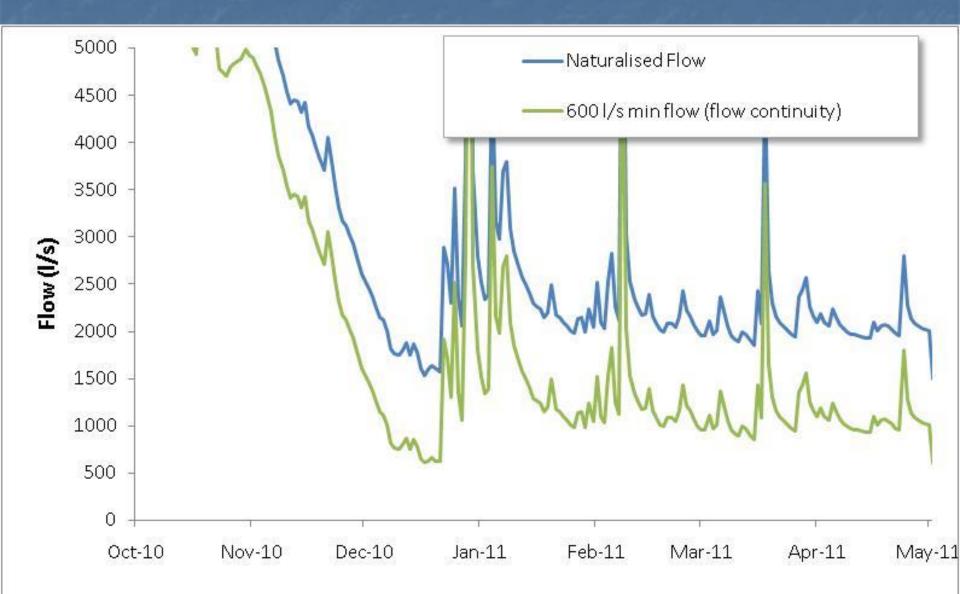

## Status quo – Wet year

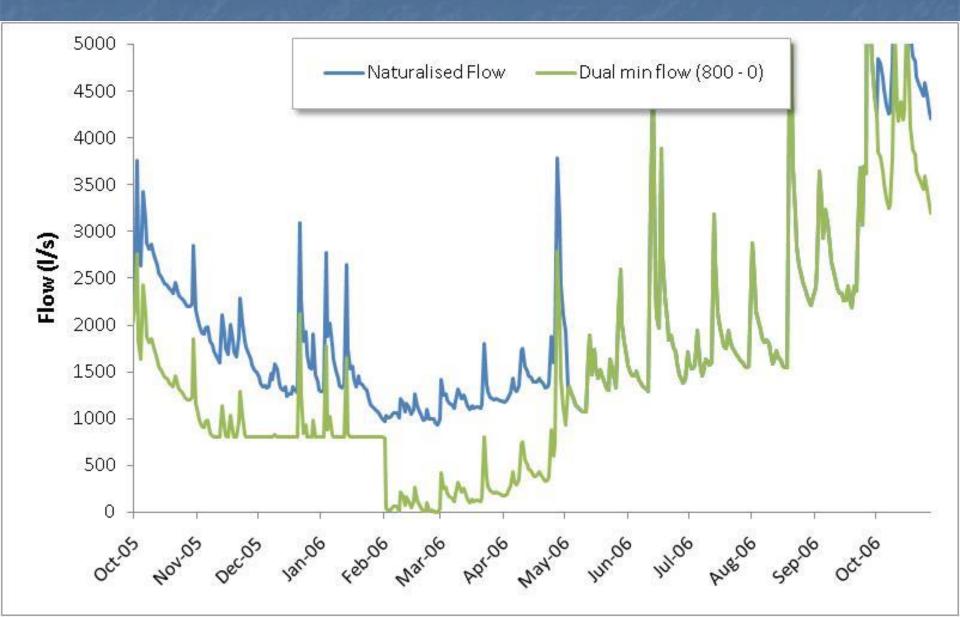

# Flow continuity (600 l/s) – Dry year

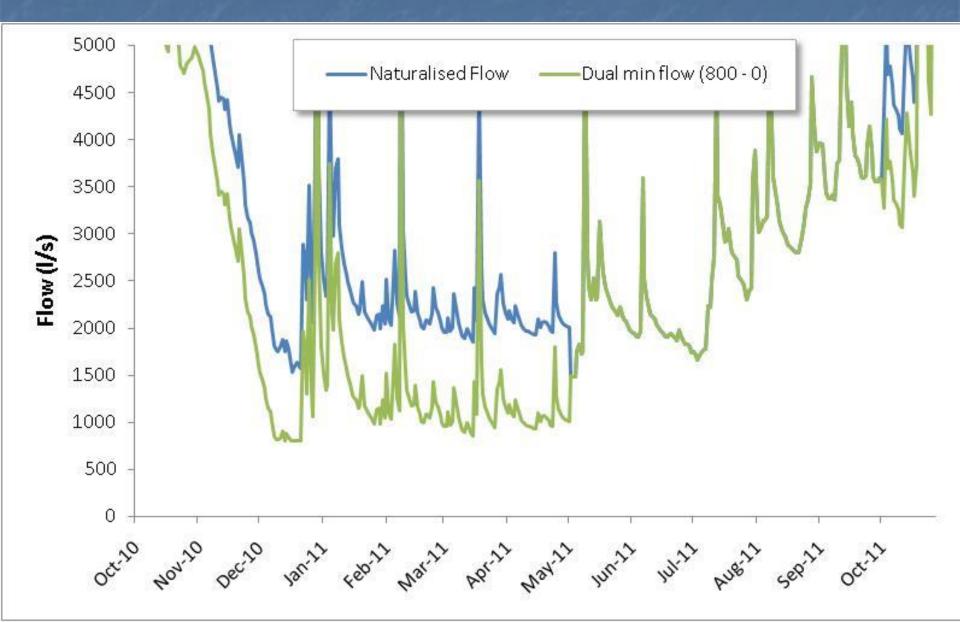

# Flow continuity (600 l/s) – Wet year

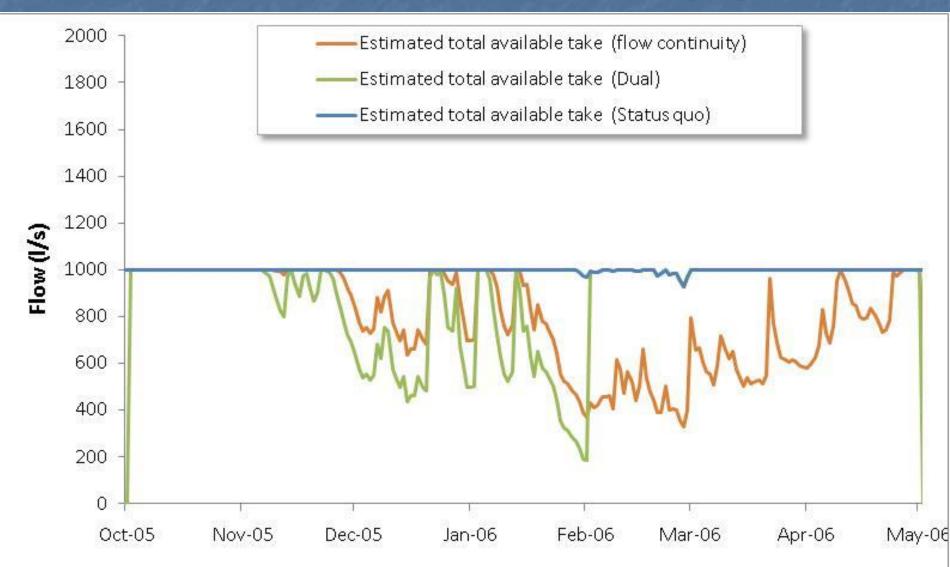

#### Dual min flow (800 – 0 l/s)– Dry year

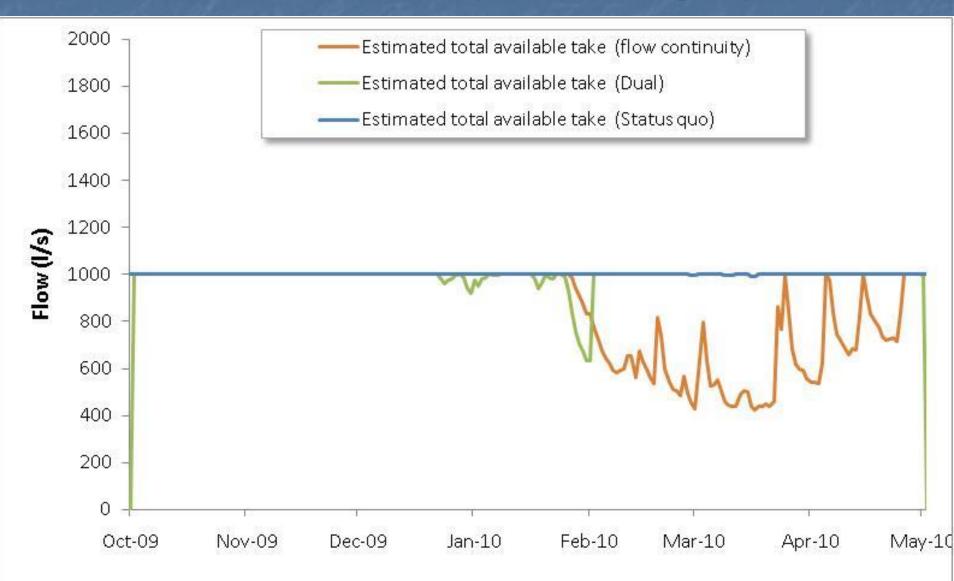

#### Dual min flow (800 - 0 l/s)– Wet year

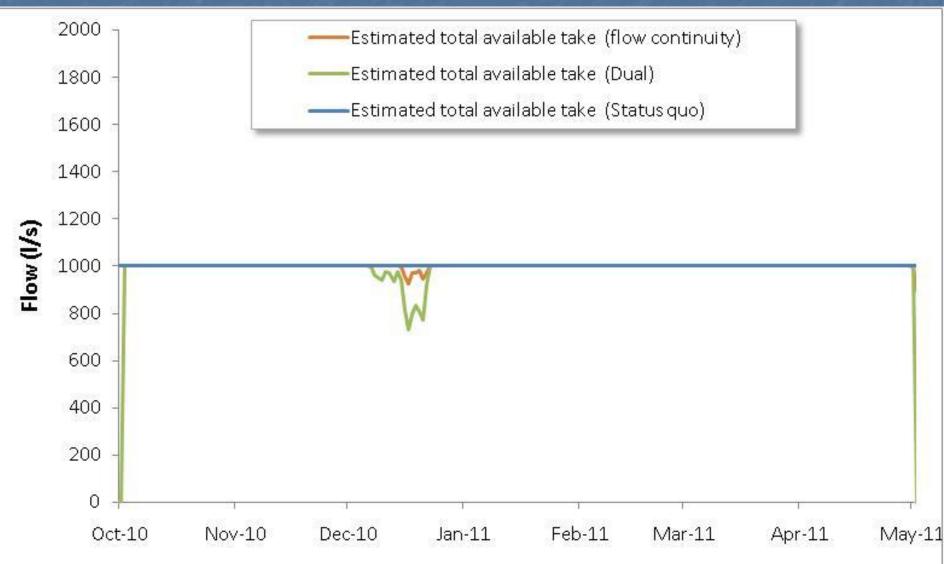

# Water availability – Dry year

#### Water availability – Average year

# Water availability – Wet year

# Integrated water resource management

Using groundwater to offset reductions in surface water availability

### Hydrology of the lower Cardrona River – a summary

Approximately 0.7 m<sup>3</sup>/s (700 l/s) of surface water is lost to groundwater between The Larches and SH6.

Once surface flows cease in the losing reach, groundwater levels in the Wanaka aquifer drop sharply

Approximately 0.3 m<sup>3</sup>/s (300 l/s) returns to the river between SH6 and the Clutha confluence

There is a total of 2.411 m<sup>3</sup>/s of primary allocation in the Cardrona catchment

 It is estimated that 1 m<sup>3</sup>/s of this is actually taken during the irrigation season

# Natural values of the Cardrona River

# Introduced fish

- Brown trout
- Rainbow trout
- Brook char
- The Cardrona River is considered a locally important brown and rainbow trout fishery
- Is one of the main spawning and juvenile rearing rivers for both brown and rainbow trout in the upper Clutha
